

Obesity
Medicine
& Stroke

Dr. Alexandra Giedd, MD MPH

Obesity Medicine Fellow, Atrium Health

INTRODUCTION

Bachelors of Science: Duke University

Masters of Public Health: George Washington

Medical School: Wake Forest

Iredell County, NCEmergency Medical Services

Family Medicine Residency: Northwestern

Obesity Medicine Fellowship: Atrium Health

Bariatrician: A physician who specializes in helping patients to achieve and maintain healthy weights through lifestyle counselling, pharmacotherapy, and surgical intervention

Contact: alexandra.giedd@atriumhealth.org

FINANCIAL DISCLOSURES

- None to report

OVERVIEW

- Defining Obesity
- Stats & Epi
- Causes & Effects of Obesity
- ***Obesity in relation to stroke***
- **Simulation: Stroke Patient**
 - EMS → ED → Imaging
 - Thrombectomy/Surgery → Inpatient care
 - Outpatient care → PT/OT

DEFINING OBESITY

Abnormal or excessive fat accumulation
that presents a risk to health

DEFINING OBESITY

- **Body Mass Index (BMI)**
- Waist circumference
- **Waist to hip ratio**
- Body fat percentage

$$BMI = \text{Weight (kg)} / \text{height (m)}^2$$

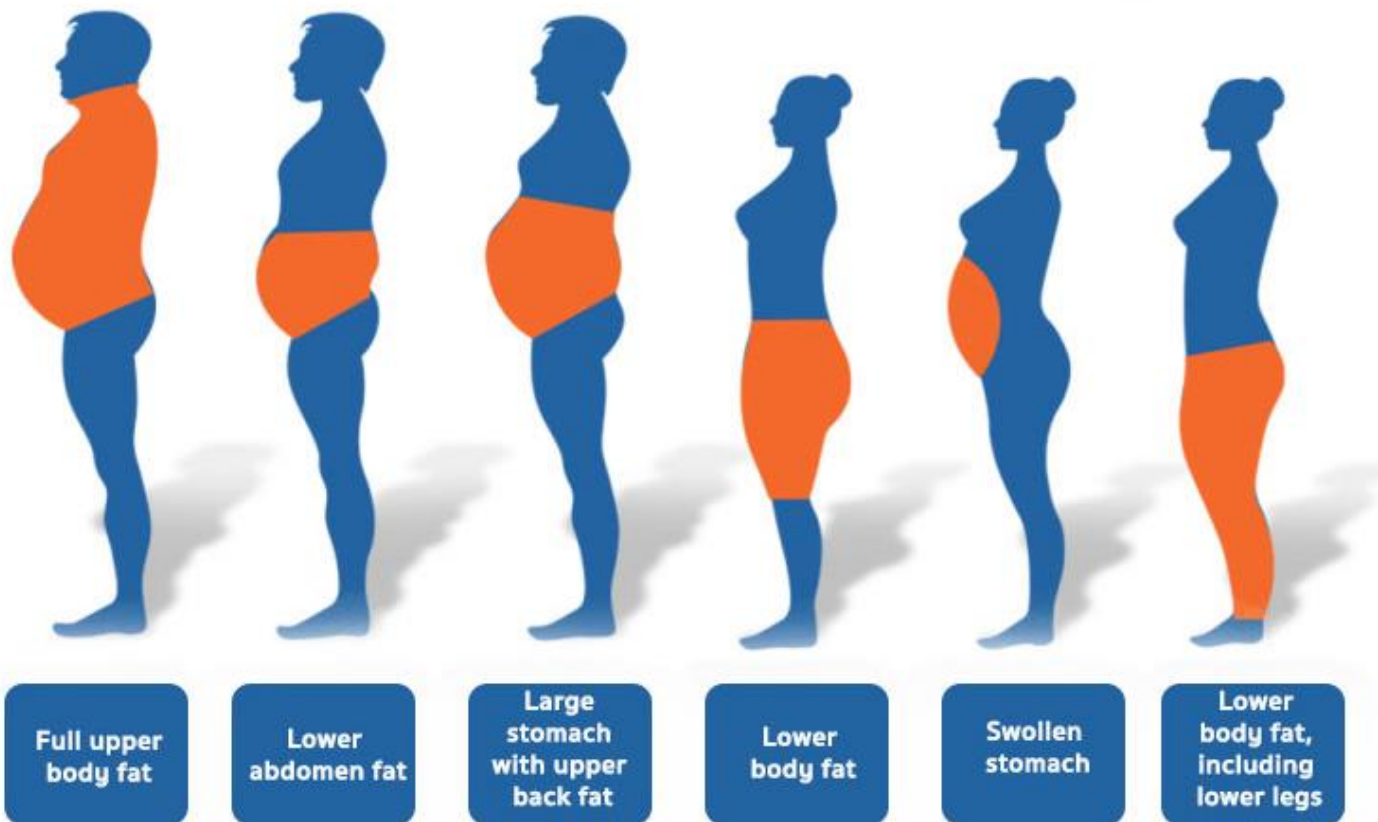

WEIGHT DISTRIBUTION

Abdominal adiposity is most likely to lead to metabolic syndrome

6 Types of Body Fat

Help fight weight bias in medicine!

- Use people-first language
- Weight ≠ Health
- Weight bias can lead to healthcare disparities
- Be a part of the solution

Over the past decade, person-first language was used in about half of diabetes-focused articles and fewer than 1% of obesity articles

POPULATION STATISTICS: USA

Majority of Americans are Overweight or Have Obesity

Percentage of American Adults with BMI>30
(Percentage of Americans Who Have Obesity)¹

Percentage of Americans Over Age 20
Who Are Overweight or Have Obesity²

Percent of Population Living with Obesity

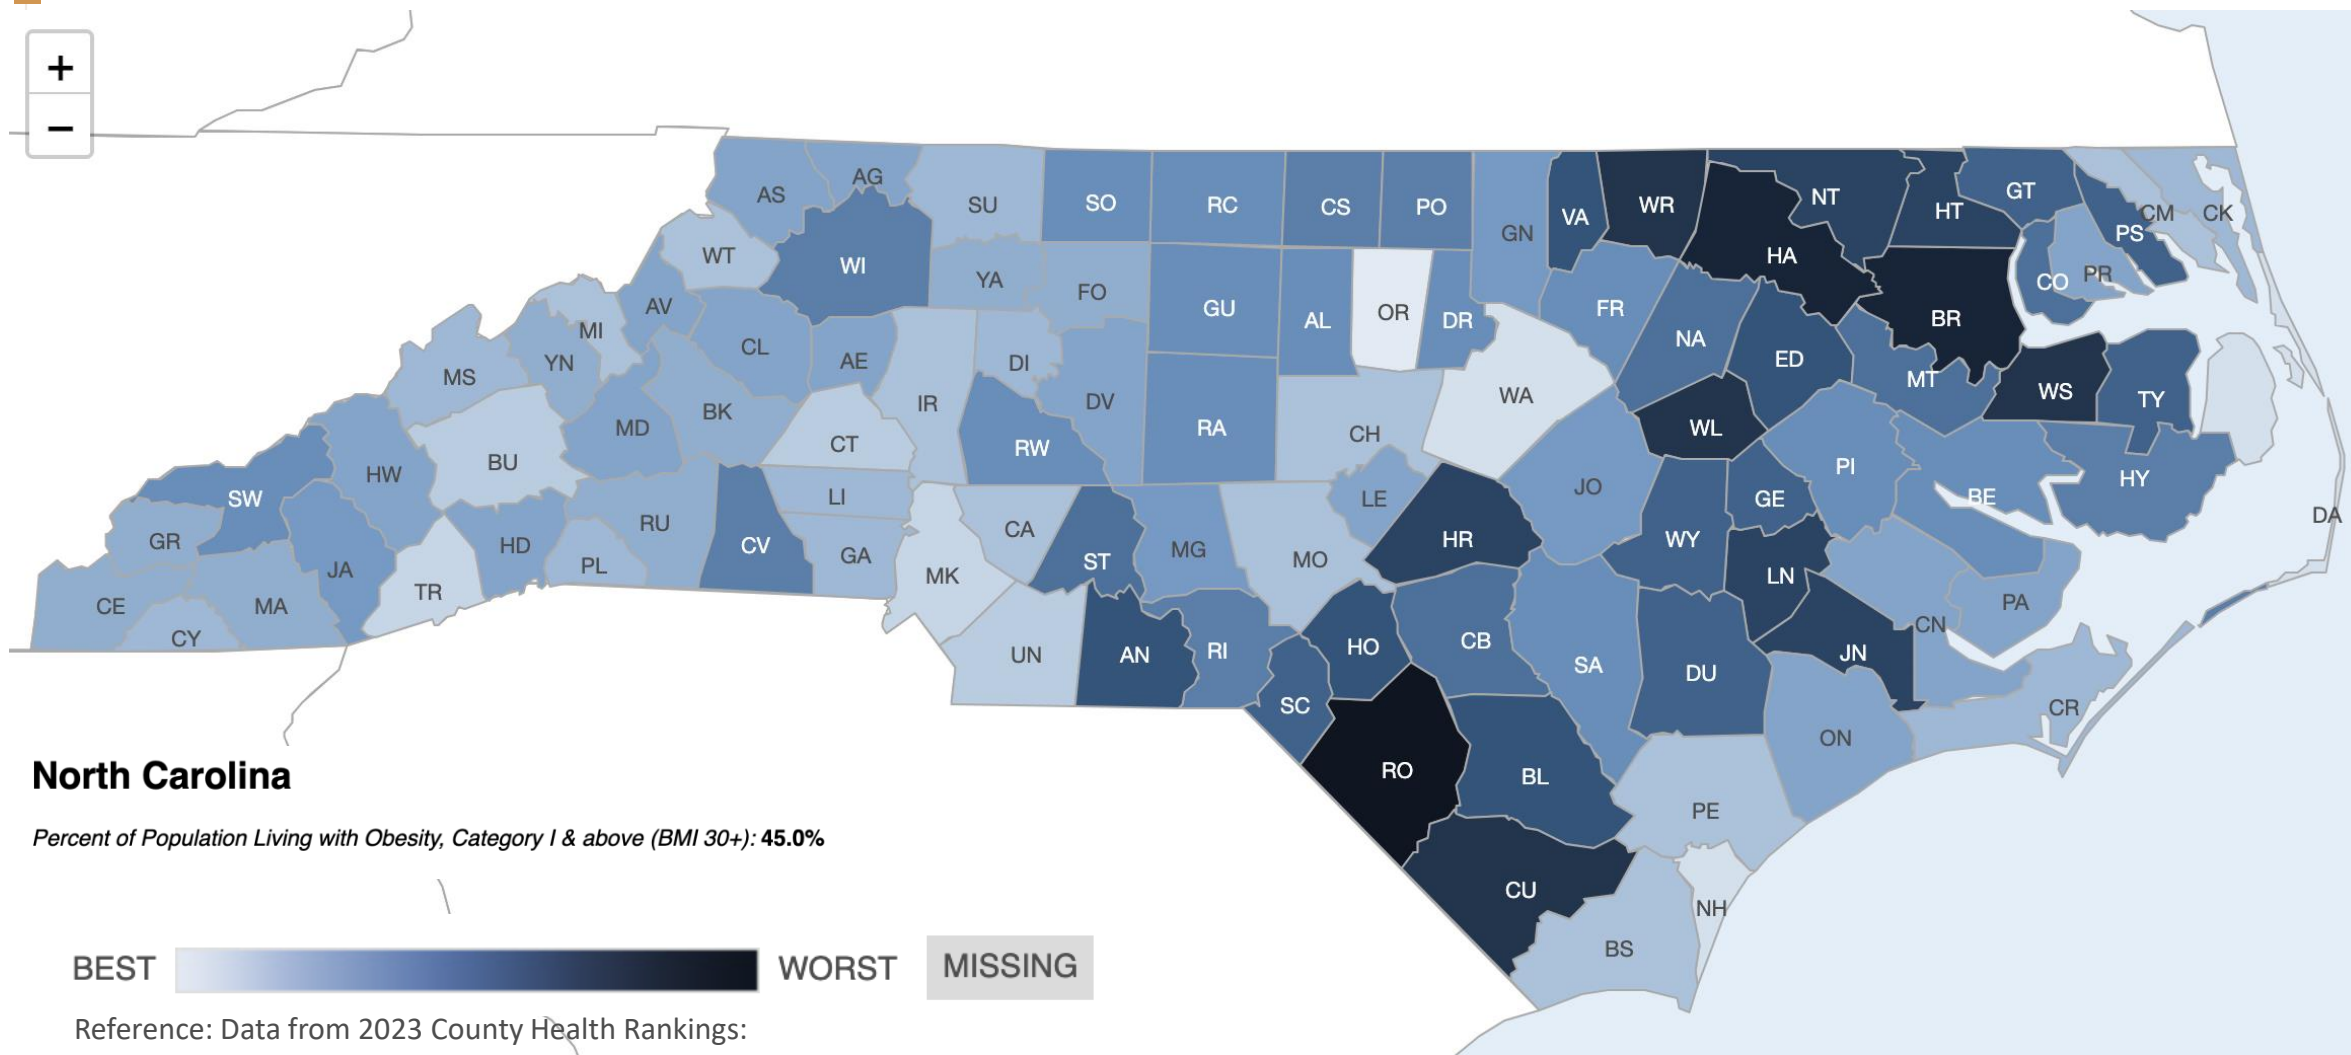

Both sexes, All races, All areas, All education levels, All ages, 2019-2021, Age-adjusted (2000 Std. Pop.)

Percent of Population Living with Obesity

<https://obesitymap.norc.org/obesityrates>

OBESITY IN NORTH CAROLINA

Prevalence of Overall Obesity (BMI, ≥ 30)

EPIDEMIOLOGY

OBESITY: CAUSES

- Internal causes
- External causes

Remember, while some factors are within a patient's control, other factors are not

OBESITY: EFFECTS

Deranged endocrine and Immune Responses

Sick Fat Disease (SFD) (Adiposopathy)

Endocrine/metabolic:

- Elevated blood glucose
- Elevated blood pressure
- Dyslipidemia
- Other metabolic diseases

Abnormal and Pathologic Physical Forces

Fat Mass Disease (FMD)

Biomechanical/structural:

- Stress on weight-bearing joints
- Immobility
- Tissue compression (i.e., sleep apnea, gastrointestinal reflux, high blood pressure, etc.)
- Tissue friction (i.e., intertrigo, etc.)

WHAT ARE THE EFFECTS OF OBESITY?

OBESITY & STROKE RISK

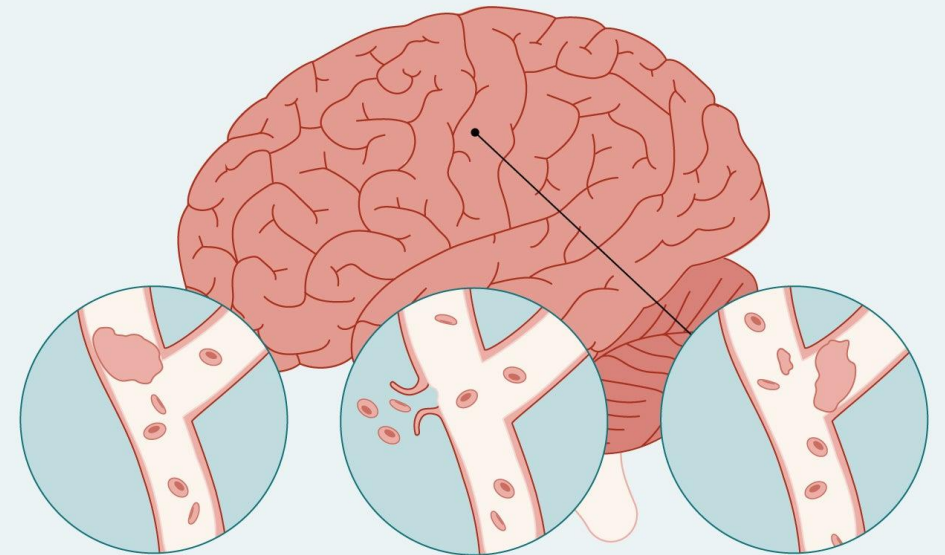

- Ischemic strokes = 87%
- Hemorrhagic strokes = 13%

Stroke is the No. 5 cause of death in the United States, killing more than 142,000.¹

1 in 19 DEATHS

TYPES OF STROKES IN THE BRAIN

ischemic stroke

hemorrhagic stroke

transient ischemic attack

QUICK LITERATURE REVIEW

- Over 60 published studies, between 1983 and 2023, have examined the association between obesity and cerebrovascular disease.
- For every 1 unit increase in BMI (≈ 7 pounds), risk of ischemic stroke increases by $\approx 5\%$

Prevention Conference VII

Obesity, a Worldwide Epidemic Related to Heart Disease and Stroke: Executive Summary

RISK FACTORS FOR STROKE

ASCVD (Atherosclerotic Cardiovascular Disease) 2013 Risk Calculator from AHA/ACC ☆

Determines 10-year risk of heart disease or stroke.

Age This calculator only applies to individuals 40-75 years of age.	<input type="text" value="Norm: 20 - 79"/>	<input type="text" value="years"/>
Diabetes	<input checked="" type="radio" value="No"/>	<input type="radio" value="Yes"/>
Sex	<input type="radio" value="Female"/>	<input type="radio" value="Male"/>
Smoker	<input checked="" type="radio" value="No"/>	<input type="radio" value="Yes"/>
Total cholesterol	<input type="text" value="Norm: 150 - 200"/>	<input type="text" value="mg/dL ↔"/>
HDL cholesterol	<input type="text" value="Norm: 0 - 60"/>	<input type="text" value="mg/dL ↔"/>
Systolic blood pressure	<input type="text" value="Norm: 100 - 120"/>	<input type="text" value="mm Hg"/>
Treatment for hypertension	<input checked="" type="radio" value="No"/>	<input type="radio" value="Yes"/>

Both sexes, All races, All areas, All education levels, All ages, :
2021, Age-adjusted (2000 Std. Pop.)

	North Carolina	United States
Percent of Population Living with Obesity, Category I & above (BMI 30+)	45.0%	42.7%
Percent of Population Living with Obesity, Category II & above (BMI 35+)	23.0%	21.0%
Percent of Population Living with Obesity, Category III (BMI 40+)	10.4%	9.4%
Percent of Population who have Cardiovascular Disease	8.4%	7.5%
Percent of Population who have had a Heart attack	3.9%	3.6%
Percent of Population who have had a Stroke	3.5%	2.9%
Percent of Population who have Angina/Coronary Heart Disease	4.0%	3.4%
Percent of Population who have Diabetes (any onset)	10.9%	10.0%
Percent of Population who have Hypertension	31.8%	30.0%
Percent of Population who have Dyslipidemia	30.3%	29.4%

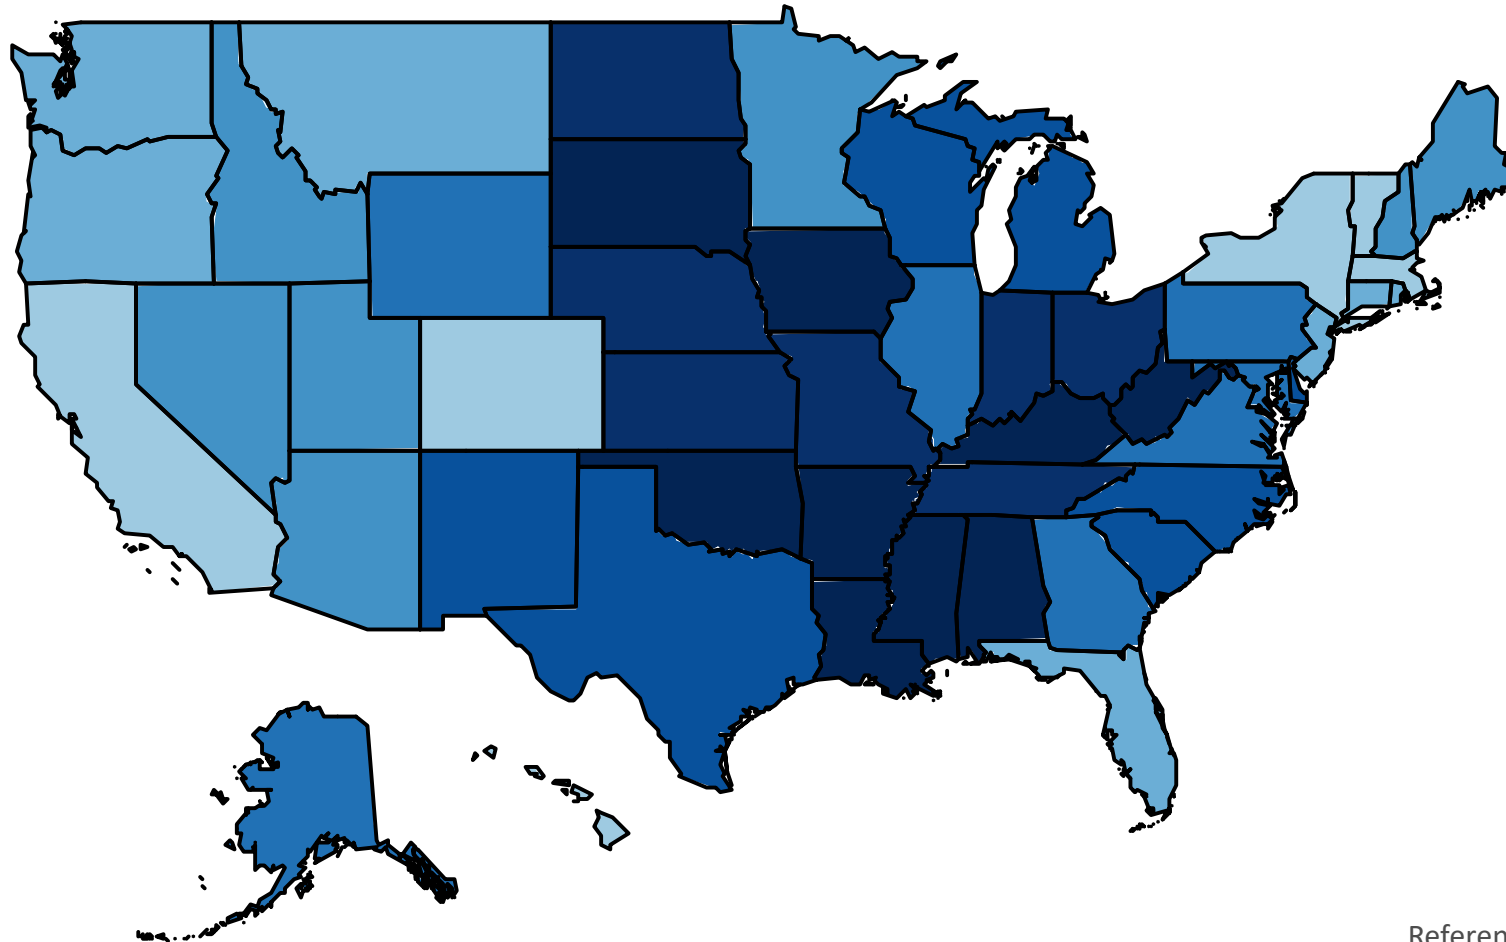

RISK FACTORS FOR STROKE

- North Carolina is part of the nation’s “Stroke Belt.”
- Eastern NC is in the “buckle” of the Stroke Belt, where stroke mortality is 40% higher than national average & hospital readmission rates are the highest in NC.
- (Tobacco use is likely a secondary independent risk factor)

Percent of Population Living with Obesity

Both sexes, All races, All areas, All education levels, All ages, 2019-2021, Age-adjusted (2000 Std. Pop.)

Percent of Population Living with Obesity

Meet Amy

Amy is a 55-y.o. female with a BMI of 76 kg/m² (net weight 530 lbs). She has history of HTN, HLD, prediabetes (last Hba1c 6.2%), lipedema, and OSA on CPAP. Her medications include amlodipine, atorvastatin, and metformin. She used to smoke ½ ppd but quit around 15 years ago, and she only consumes alcohol on special occasions.

She lives at home with her husband and step-daughter in a 2nd story duplex in Wilkes county, NC. Her physical activity is somewhat limited due to lipedema and knee pain, but she can ambulate up and down stairs if she leans on the railings. She occasionally uses a cane for longer walks but is fully independent in her ADLs/IADLs.

She works as a secretary for a local lumber company, and mostly works from home. She tries to eat a low sodium and low carb diet due to her other health conditions, and she enjoys cooking for her family, but often struggles with obtaining fresh foods, as the nearest grocery is over 25 minutes away in here rural county. She enjoys singing and playing guitar in her free time and helps with the choir and instrumentals at her church.

EMS is called for patient with stroke-like symptoms

- Is appropriate information communicated on EMS call to bring appropriate personnel and equipment
- Consider stair and door access
- Are there any airlift protocols?
- Which hospital should patient be transported to
 - Is there a list of bariatric-accommodating regional hospitals?

Patient Enters Emergency Department

- Is there appropriate medical equipment to take urgent vitals
- Transporting patient
- Appropriate medication administration devices
- Are appropriate personnel on hand to assist with potentially more difficult intubation/IV access etc?
- If patient requires CPR, are appropriate protocols in place?

Patient needs urgent imaging

- Will patient be able to fit in CT/MRI scanner/ on
- Average CT scanner weight limit is 500 lbs, though some bariatric CT scanners may be able to accommodate up to 650 pounds
- Average bore size/ gantry aperture between 70-78 cm
- How may image quality be affected?

Patient undergoes Thrombectomy

- What challenges may surgical/IR/anesthesia providers face?
- Is there a bariatric toolset?
- Can OR table accommodate patient?
- Could lipedema complicate femoral access?
- Is anesthesia able to sedate quickly and appropriately?
- Reverse Trendelenburg position may assist with easier ventilation

Patient survives, admitted to hospital

- Bariatric-friendly hospital beds
- Medication administration
- Preventing sores and bed ulcers
- Safely moving patient
- Cleaning patient

Patient attends outpatient hospital follow-up

- Patient transportation
- Chairs and exam tables
- BP cuff
- Scale
- Physical exam/ neuro exam

Patient attends stroke rehab: PM&R/PT/OT

- Moving and assisting patient
- Functional rehabilitation
- Appropriate sized braces/bars/devices etc

Amy comes home!

- What challenges may Amy face once she returns home?
- What resources could be able to provide her and her family?
- Will she need assistance with ADLs/IADLs?
- What DME may be appropriate?
- If she experiences another stroke, what could we change this time around?

CONCLUSIONS

- Weight bias causes healthcare disparities
 - Less likely to engage in preventative health services
 - Under/misdiagnosis
 - Structural barriers
 - medical equipment – BP cuff
 - OR tables
 - MRI/CT scanners
 - Surgery weight cut offs

QUICK TREATMENT = LESS BRAIN DAMAGE!
Importance of Getting to the Hospital Quickly

Get to the hospital at the first sign of stroke so you can be evaluated and receive treatment in time. Stroke treatment begins in the ambulance. Calling 9-1-1 can help patients get treated more quickly and get them to a hospital that specializes in stroke care.

Clot busters and clot-removal procedures must be administered within a few hours of stroke symptoms to lessen the chance of being disabled after a stroke.

Mechanical thrombectomy is a procedure that can physically remove a large blood clot from a blocked artery in the brain.

A background network diagram consisting of numerous nodes (dots) connected by thin lines, forming a complex web. The nodes are colored in shades of brown, tan, and grey, and the lines are thin and light-colored. The overall appearance is that of a data network or a social graph.

Questions?

Thank you!
